Abstracts

The global Septum-Type Infusion Connector market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The septum-type infusion connector is a device commonly used in the medical field for connecting infusion lines for infusion or drug administration. This joint usually consists of two female connectors separated by a hollow septum. When the two connectors are inserted, the separating membrane is punctured, creating a pathway through which infusion fluid or medication can flow. The advantage of the septum-type infusion joint is that it can effectively prevent contamination and air bubbles from entering the infusion line during the infusion process. It also reduces unnecessary drug waste because when the infusion or drug is finished, it can be disconnected and the entire infusion line does not need to be replaced.
