## Abstracts

According to our (Global Info Research) latest study, the global Serf Atomic Magnetometer market size was valued at US\$ 164 million in 2025 and is forecast to a readjusted size of US\$ 289 million by 2032 with a CAGR of 8.5% during review period.

SERF atomic magnetometer is a highly sensitive magnetic field measurement device based on the principle of spin exchange relaxation suppression of alkali metal atoms. It can achieve magnetic field detection at the femtotesla (fT) level in extremely weak magnetic field environments. Its core feature is that through high-temperature heating and optical pumping technology, atomic spin exchange collisions do not cause relaxation, thereby greatly extending the atomic spin coherence time and improving the sensitivity of magnetic field measurement.

SERF (Spin-Exchange Relaxation-Free) atomic magnetometer technology has achieved femtotesla (fT) level sensitivity in laboratory environments and has become a core tool in the field of biomagnetic field measurement. At present, North America and Europe dominate (accounting for more than 70%), mainly benefiting from scientific research investment and medical needs; the Asia-Pacific region is growing rapidly, and China, Japan and other countries have increased their research and development efforts in the biomedical field.
