The global Serial Interface Display Driver market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A serial interface display driver is an electronic device used to drive a liquid crystal display, typically for digital display applications. They use a serial interface communication protocol to communicate with a host controller or processor and transfer data to an LCD display. The serial interface display driver is usually composed of multiple chips, including driver chips, control chips, and power chips. They can accept instructions and data from a host controller or processor and convert them into recognizable signals to control the brightness and color of each pixel in an LCD. Serial interface display drivers are often used in low-power applications because their circuit design is relatively simple, usually requiring only a small amount of power and signal lines to function. They are widely used in small electronic products such as digital photo frames, handheld devices, mobile phones, and smart watches.
