According to our (Global Info Research) latest study, the global Series Backlight LED Driver market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Series backlight LED driver is a circuit used to control multiple LED strings, which can ensure that the current of each string is equal, so as to achieve uniform backlighting. Serial backlight LED drivers are usually used for backlighting LCD screens, such as TVs, tablets, notebooks, etc. Series backlight LED driver has the following advantages: It can reduce the driving voltage, reduce power consumption and heat dissipation. It can improve system efficiency and reliability, and avoid single point failure and thermal runaway. It can increase the brightness and contrast of the screen and improve the display effect. The principle of series backlight LED driving is to use components such as current mirrors or current sensors to copy or detect a reference current and distribute it to each LED string. This can ensure that the current of each LED string is consistent with the reference current, and is not affected by factors such as LED forward voltage drop, temperature, and aging. There are many ways to implement serial backlight LED driving, for example: use a constant current source as a reference current, and use a bipolar transistor or a field effect transistor to form a current mirror. Use a constant voltage source as a reference voltage and pass through an operational amplifier or differential amplifier to form a current sensor. The integrated circuit chip is used as a dedicated backlight LED driver, and the current control and regulation functions of multiple channels are integrated inside.
