Abstracts

According to our (Global Info Research) latest study, the global Server Multiphase Power Supply market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Multiphase power supply belongs to the DC-DC converter in the power management chip. It converts the external DC input voltage into a DC working voltage of the applicable level in the chip and electronic product execution device. It is a type of product used in the low-voltage and high-power field.

Multiphase power supply consists of two parts: multiphase controller and DrMOS. By using the outputs of multiple step-down circuits in parallel, it can output hundreds of amperes to thousands of amperes of current, and has higher efficiency and lower heat dissipation at the same power, providing power supply solutions for high-performance computing applications.

DrMOS integrates two Mosfet and Mosfet driver in one chip to increase conversion efficiency, reduce electromagnetic interference, and effectively reduce the heat generation of MOS tubes. Especially for the server market, efficiency is an extremely critical indicator.

The multiphase controller is the "brain" of the multiphase power supply, bridging the CPU/GPU and DrMOS. The multiphase controller is responsible for communicating with the CPU/GPU, etc., and feeding back the results to the driver, so as to accurately control the circuit.

With the rise of big data, cloud computing, and artificial intelligence, greater computing power and higher power consumption of CPU/GPU/ASIC are needed, which also places higher requirements on load power supply. Multi-phase power supply is recognized as the best solution for such application scenarios and is widely used in data centers, smart driving, communications and other fields.
