Abstracts

According to our (Global Info Research) latest study, the global Serverless Cloud Function market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Serverless Cloud Function helps users run code without purchasing and managing servers. Users only need to use the language supported by the cloud platform to write the core code and set the conditions for the code to run, the code can run elastically and safely on the Tencent Cloud infrastructure, and can fully manage the underlying computing resources, including server CPU, memory, network, code deployment, elastic scaling, load balancing and other services. The use of serverless cloud functions will eliminate all operation and maintenance operations, and enterprises and developers can focus more on the development of core business, achieve rapid launch and iteration, and grasp the rhythm of business development.

In scenarios such as mobile and web service backends, video image processing, and data analysis, serverless cloud functions can well meet diverse needs with its advantages of ease of use, high efficiency, flexibility, on-demand, and low price.

Serverless cloud functions are one of the best ways to implement microservices, and their inherent event-driven (event-driven) and stateless (stateless) attributes just meet the requirements of the microservice architecture. Each service (that is, a function) has almost unlimited processing capacity, and can automatically complete expansion and contraction following the fluctuation of business requests. If cloud servers are used to build service modules, even when the usage is very low (according to estimates, the average utilization rate of data center servers is only about 15%), corresponding hourly

fees will still be paid. On the other hand, cloud functions are charged according to the actual usage, and the billing ends immediately after the operation is completed. The price is very easy to predict, and there is no cost if there is no request. The price advantage is obvious.

On the whole, cloud functions can realize a series of advantages such as independent development, simplified testing and accelerated deployment, which can help enterprises to go online and iterate quickly in critical periods, and provide a good solution for products in the initial stage.
