The global Serverless Computing Platform market size is expected to reach \$ 71324 million by 2032, rising at a market growth of 13.8% CAGR during the forecast period (2026-2032).

A Serverless Computing Platform (Function-as-a-Service platform) is a cloud-native development and operation platform that abstracts underlying server management. Developers only focus on writing business code and functions, without needing to deploy, maintain or manage physical/virtual servers, operating systems or runtime environments. The platform automatically handles resource scheduling, scaling, load balancing and operation maintenance, and charges resources based on actual usage. It is widely used for lightweight APIs, event-driven services, scheduled tasks, data processing and microservice scenarios.

The global serverless computing market is in a state of robust expansion, driven by the widespread adoption of cloud-native architectures, event-driven application designs, and the need for enhanced developer agility.

The market is not monolithic, and its growth is propelled by several key segments.

Service Model Dominance: Function-as-a-Service (FaaS): FaaS, which lets developers run code for specific functions in response to events, is the bedrock of the serverless market. Its popularity stems from being a natural fit for microservices and event-driven architectures.

Deployment Model Leadership: Public Cloud: The public cloud is the dominant deployment model. Its appeal lies in its unmatched scalability, pay-as-you-go pricing,

and the rich ecosystems of managed services offered by hyperscalers like AWS, Azure, and Google Cloud.

Fastest-Growing Segment: Serverless Databases: While serverless compute leads in market share, serverless databases and analytics services are the fastest-expanding category. Organizations are increasingly adopting fully managed, auto-scaling data platforms to power their AI, real-time processing, and modern transactional applications without the overhead of database administration.
