## Abstracts

A Service Mesh is a dedicated infrastructure layer for handling service-to-service communication. It’s responsible for the reliable delivery of requests through the complex topology of services that comprise a modern, cloud native Deployment. In practice, the Service Mesh is typically implemented as an array of lightweight network proxies that are deployed alongside Deployment code, without the Deployment needing to be aware.

The core of Service Mesh is to provide a unified global method to control and measure all request traffic between Deployments or services. For companies that adopt microservices, this request flow plays a vital role in the operation of the system. Since services work by responding to requests for uploading images and making requests, the flow of requests becomes a key factor in determining the behavior of the Deployment at runtime. Therefore, the management of standardized traffic will become the entry point for standardized Deployment runtime operations.

According to our (Global Info Research) latest study, the global Service Mesh market size was valued at US$ 327 million in 2023 and is forecast to a readjusted size of USD 3426 million by 2030 with a CAGR of 40.3% during review period.

Global core service mesh manufacturers include Buoyant, HashiCorp etc. The top 3 company hold a share about 30%. North America is the largest market, with a share about 64%, followed by Asia Pacific and Europe with the share about 17% and 15%.
