## Abstracts

According to our (Global Info Research) latest study, the global Servo Hub Motor market size was valued at US\$ 621 million in 2025 and is forecast to a readjusted size of US\$ 1886 million by 2032 with a CAGR of 17.4% during review period.

Servo hub motor is a highly integrated mechatronic drive device that deeply integrates servo motor control technology with wheel hub motor structure design. Its core feature is to achieve precise torque, speed and position control inside the wheel hub through built-in high-precision encoders, closed-loop control algorithms and power electronic devices, while omitting traditional transmission components such as reducers and couplings.

The market driver of servo hub motor mainly comes from the demand for high-precision and high-response power systems in industrial automation, collaborative robots and high-end mobile robots. Its integrated design (servo control + wheel hub drive) can significantly improve motion control performance and simplify mechanical structure, meeting the precise positioning and dynamic adjustment requirements of AGV/AMR, medical robots and other scenarios. However, this technology faces technical challenges of deep integration of servo system and wheel hub motor (such as high-precision encoder integration, thermal management optimization), high cost (precision servo drive components push up prices) and reliability issues under complex working conditions (the impact of vibration and shock on servo control stability). Despite the barriers, with the advancement of intelligent servo algorithms and modular design, its penetration rate in the high-end robot market is expected to accelerate.
