Abstracts

A servo linear encoder is a sensor device used to measure linear displacement. It usually consists of a sensor head and a scale bar. There are a series of scale lines on the scale bar. The sensor head can read the signals on these scale lines to determine the position of the object. Servo linear encoders can provide high-precision position measurement and are usually used in servo systems, CNC machine tools, robots and other equipment that require precise position control. By monitoring position information in real time, servo linear encoders can help control systems achieve high-precision position control and motion control.

According to our (Global Info Research) latest study, the global Servo Linear Encoder market size was valued at US$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
