According to our (Global Info Research) latest study, the global Servo Linear Motor market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A linear servo motor is an electric motor that does not have a built-in rotating shaft and is capable of linear motion for use in servo mechanisms utilized in machine control.

While general motors perform rotary type motion, linear motors generally perform linear type motion. Linear motors themselves are devices for driving and propulsion widely known as linear motor cars, etc. Servomotors are motors used to control position, speed, etc. in servo mechanisms.

Until recently, rotary servo motors have been the mainstay of linear motion systems for industrial machinery and measuring instruments, but in recent years, linear servo motors, which operate by the action of the magnetic flux generated by a permanent magnet and the current flowing through a coil (Fleming's left-hand rule), have been attracting attention.
