The global Shale Oil and Gas Fracturing Water Supply Hoses market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Shale oil and gas fracturing water supply hoses are hoses that are used to transport water from a source to a wellsite where hydraulic fracturing is performed. Hydraulic fracturing is a technique used to enable the extraction of natural gas or oil from shale and other forms of “tight” rock (in other words, impermeable rock formations that trap oil and gas and prevent it from flowing freely). Hydraulic fracturing involves injecting water mixed with chemicals and proppants under high pressure through the well tubing to the target formation, creating fractures that allow oil or gas to flow into the well bore. The water supply hoses are designed to withstand high pressures, abrasion, corrosion, and extreme temperatures .
