Shallow sea valves are used to isolate or control the flow of materials through submarine pipelines (subsea pipelines) or other equipment, and are key components of underwater oil production and underwater manifolds. They are most commonly used to transport oil and natural gas, designed to function in the submarine environment, and play an important role in underwater oil production equipment. They can not only withstand the increased external pressure, but also resist salt water corrosion and the impact of bubbles or debris in the flowing liquid or gas being transported.
