A shielded USB cable is a USB data transmission line used to connect devices and hosts. Compared with ordinary USB cables, its main feature is that it has a shielding layer to protect the signal from external electromagnetic interference. The shielding layer is usually made of copper foil, aluminum foil, braided mesh and other materials, covering the outer insulating layer of the USB cable, effectively reducing the impact of external electromagnetic interference on signal transmission, and improving the stability and reliability of data transmission.

Shielded USB cables are usually divided into two specifications, USB 2.0 and USB 3.0, and can be used to connect various devices such as computers, peripherals, and mobile devices. In addition to the shielding layer, the shielded USB cable also has the characteristics of high-speed transmission, strong reliability, and durability, and is widely used in various fields such as data transmission, audio and video transmission, and printing.
