Abstracts

The global Ship Anti-corrosion Material market size is expected to reach \$ 10325 million by 2032, rising at a market growth of 6.1% CAGR during the forecast period (2026-2032).

Marine anti-corrosion materials are a general term for materials specifically designed to protect ships, marine engineering equipment, and their metal structures from seawater, salt spray, humid and hot environments, electrochemical corrosion, biofouling, and chemical corrosion. They mainly include anti-corrosion coatings, antifouling coatings, cathodic protection materials, anti-corrosion adhesives, anti-corrosion sealing materials, anti-corrosion composite materials, and surface treatment materials. Their core function is to form a physical barrier or electrochemical protective layer on ship hull steel structures, ballast tanks, decks, cargo holds, offshore platforms, and subsea pipelines, extending equipment service life, reducing maintenance costs, improving fuel efficiency, and meeting the anti-corrosion specifications of the International Maritime Organization (IMO) and classification societies.

The marine anti-corrosion materials industry will continue to benefit from the global shipbuilding industry recovery, offshore wind power expansion, offshore oil and gas development, and the upgrading of international environmental regulations. As shipowners increase their demands for fuel efficiency and carbon emission reduction, the demand for next-generation low-friction hull coatings, self-polishing antifouling coatings (SPC), silicon-based non-toxic antifouling coatings, graphene anti-corrosion coatings, self-healing coatings, and intelligent monitoring coatings is growing rapidly. Meanwhile, the International Maritime Organization (IMO) requirements regarding VOC emissions, biofouling management, and carbon intensity index (CII) are driving the upgrade of traditional solvent-based products to high-solids, water-based, and solvent-

free systems.
