## Abstracts

According to our (Global Info Research) latest study, the global Ship Performance Monitoring Software market size was valued at US\$ 613 million in 2025 and is forecast to a readjusted size of US\$ 870 million by 2032 with a CAGR of 5.2% during review period.

Ship Performance Monitoring (SPM) software is a specialized information system based on IoT, data acquisition, and cloud computing technologies. It's used to collect, analyze, and visualize real-time ship navigation and equipment operation data. By connecting to onboard sensors and automation systems, it continuously collects multi-dimensional data on main and auxiliary engine conditions, fuel consumption, speed, attitude, and environmental conditions. Its core function is to process and model this data, calculate energy efficiency indicators, and provide fleet managers with fuel consumption analysis, anomaly warnings, maintenance recommendations, and navigation optimization solutions. The ultimate goal is to achieve cost reduction and efficiency improvement, ensure navigation safety, and meet increasingly stringent International Maritime Organization (IMO) energy efficiency and emissions regulations.

The ship performance monitoring software market has broad prospects and strong growth momentum. The core driving force is the shipping industry's urgent need for cost reduction, efficiency improvement, and emissions reduction. IMO regulations such as the Carbon Intensity Index (CII) are forcibly driving the digital upgrade of the fleet. In the future, software development will exhibit trends of deep intelligence and high integration: Artificial intelligence (AI) and machine learning will transform from data analysis tools into embedded decision-making systems, enabling more accurate predictive maintenance and energy efficiency optimization; simultaneously, software will

serve as the core of 'digital twins' and unified data platforms, integrating multi-source information such as mechanical data, video data, and vibration data to support remote collaboration and autonomous ship operations. With the widespread adoption of low-cost sensing and edge computing technologies, this technology will also expand from large fleets to a wider range of small and medium-sized ship owners.
