Abstracts

The global Ship Plate market size is expected to reach \$ 42230 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032).

The ship plate is a hot rolled steel sheet produced to manufacture hull structures as required by the code of conduct. In the 1870s carbon was added to molten iron to make steel. Iron and steel were soon being used in ship production. These irons and steels were known as ABS (American Bureau of Shipping) iron and steel. They constitute specific types of iron and steel utilized to build ships. How they are manufactured and used is regulated by the ABS standardized grading and specification system.

As the global shipping industry moves towards large-scale, high-efficiency and low-carbonization, ship plates, as the core raw materials for shipbuilding, are becoming an important direction of the marine materials industry chain through technical upgrading and structural optimization. Ship plates are mainly divided into ordinary strength ship plates (such as A, B, D grades) and high-strength ship plates (such as AH32, DH36, EH40, etc.). The former are mostly used for offshore ships and small structural parts, while the latter are widely used in key load-bearing parts of the hull such as medium and large tankers, bulk carriers, container ships, chemical tankers, etc. to meet higher strength and corrosion resistance requirements. In recent years, with the rise of new green ship types such as LNG ships and dual-fuel ships, more stringent standards have been proposed for ship plates, such as low-temperature impact toughness, hydrogen embrittlement resistance, high strength-to-toughness ratio and welding adaptability.

The major global ship plate manufacturers include POSCO, JFE Steel, NSSMC, Baostee, Valin Xiangtan Steel, etc. The top five global manufacturers account for about 50% of the market share. Asia Pacific is the world's largest ship plate market,

accounting for about 80% of the market share, followed by Europe and North America, which together account for about 10% of the market share.

The future development of ship plates will revolve around four directions: higher strength grades (such as ultra-high strength steel) to reduce hull weight and improve cargo efficiency; stronger corrosion resistance to adapt to polar routes and long-term offshore operating environments; more functional composite ship plates to integrate noise reduction, flame retardant or anti-microbial adhesion properties; more environmentally friendly manufacturing processes to reduce carbon footprint and adapt to ESG standards. In addition, digital twins and intelligent manufacturing will also be integrated into the ship plate quality management and delivery system to improve production efficiency and full life cycle service capabilities.

For ship plate manufacturers, they should actively adapt to the trend of global shipping green transformation: on the one hand, they should accelerate the innovation of ship plate material systems and deploy new categories such as ultra-thick plates, high-alloy steel and nitrided steel; on the other hand, they should deepen the collaborative development mechanism with ship companies, classification societies, and shipping companies to create 'customized ship plate solutions' and 'batch full life cycle traceability system' to win core customers with differentiated service capabilities. At the same time, we also need to pay attention to the impact of the global carbon border adjustment mechanism (CBAM), and make preparations in advance for green smelting processes, LCA assessments, low-carbon product certification, etc., to ensure that we can maintain our dual commanding heights of technology and cost in the new round of shipbuilding industry upgrade cycle.
