Abstracts

The global Ship Radar market size is expected to reach \$ 965 million by 2032, rising at a market growth of 7.4% CAGR during the forecast period (2026-2032).

Ship Radar is a marine monitoring system based on radar technology, which is used to track and monitor the real-time position, speed, heading and other important information of ships. It uses ground stations and satellite networks to receive the Automatic Identification System (AIS) signals sent by ships, integrates these data and displays them on digital maps for applications such as ship management, navigation safety and maritime supervision. The Ship Radar system is widely used in maritime traffic control, port management, maritime safety and search and rescue, and helps to improve the safety and efficiency of maritime transportation.

The continued growth of the global shipping industry and the increase in maritime trade volume have driven the demand for ship radar market. With the rise in international trade and ocean shipping demand, the number of ships and shipping frequency have gradually increased, and modern navigation and obstacle avoidance radar equipment has become the basic configuration for shipping companies to ensure navigation safety. Maritime regulatory agencies in various countries have continuously increased their attention to maritime safety and introduced more stringent safety regulations. In order to meet the safety standards of organizations such as the International Maritime Organization (IMO), shipowners and shipping companies have upgraded ship radar equipment to ensure collision avoidance capabilities and environmental identification accuracy during navigation and reduce the risk of maritime accidents.

This report studies the global Ship Radar production, demand, key manufacturers, and key regions.
