A searchlight (or spotlight) is an apparatus that combines an extremely luminous source (traditionally a carbon arc lamp) with a mirrored parabolic reflector to project a powerful beam of light of approximately parallel rays in a particular direction, usually constructed so that it can be swiveled about.

Searchlights were first used in the First World War to create 'artificial moonlight' to enhance opportunities for night attacks by reflecting searchlight beams off the bottoms of clouds, a practice which continued in the Second World War. The term 'artificial moonlight' was used to distinguish illumination provided by searchlights from that provided by normal moonlight, which was referred to as 'movement light' in night-time manoeuvres. Searchlights were also heavily used in the defense of the UK against German nighttime bombing raids.

In this report, we only discuss about the searchlight actually used on ships.
