Abstracts

The global Shoe Press Belts market size is expected to reach \$ 25.21 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032).

In 2025, global Shoe Press Belts production reached approximately 427 units, with an average global market price of around 40 k USD per unit. Shoe press belts, crucial in paper - making, are flexible components of shoe press systems. Usually made of rubber - like materials, they cover the shoe roll. During operation, they work with the shoe plate to create a wide nip, evenly pressing paper sheets for efficient water removal. Their durability and flexibility are key to stable press operation.

The global market for shoe press belts is primarily driven by sustained energy-saving and cost-reduction efforts across the paper industry. As a core consumable component of shoe press systems, shoe press belts have a limited service life and require periodic replacement, generating recurring demand from paper mills. Belt dewatering efficiency and durability directly affect press section performance, sheet dryness, and subsequent steam consumption in the drying section, which in turn impacts overall production costs. On the supply side, shoe press belt manufacturing involves high technical barriers, with a limited number of established suppliers holding advanced capabilities. In China, the industry has progressed from import dependence to domestic production, with locally manufactured shoe press belts gaining technical maturity and market acceptance, now deployed across multiple domestic paper machines. From a policy perspective, shoe press technology has been explicitly listed as a recommended application in regional paper industry development guidelines in China, encouraging paper mills to pursue energy efficiency retrofits. In summary, global market growth for shoe press belts is underpinned by ongoing maintenance demand from existing paper machines, initial equipment needs for new production lines, and the fundamental industry-wide objective

of reducing energy consumption per ton of paper through improved dewatering efficiency.
