## Abstracts

The global Shore Power Solution market size is expected to reach \$ 3377 million by 2032, rising at a market growth of 11.0% CAGR during the forecast period (2026-2032).

Shore power solutions refer to shore-based electrical systems that supply electricity to vessels while berthed at ports, allowing onboard auxiliary engines to be shut down and thereby reducing emissions, noise, and fuel consumption. These systems typically include power conversion units, frequency converters, transformers, cable management systems, connectors, and control and safety components, and are designed to meet varying voltage and frequency requirements of different vessel types. From a value chain perspective, upstream activities include power electronics, transformers, switchgear, cables, and control components, midstream processes focus on system integration, installation, testing, and compliance with international standards, while downstream demand is driven by port authorities, terminal operators, shipowners, and cruise operators. The industry maintains a gross margin of 30%–50%, supported by high system integration value, regulatory-driven demand, limited qualified suppliers, and long project cycles.

The shore power solution market has been experiencing significant growth in recent years, driven by several trends: Increasing environmental regulations: With a growing focus on reducing greenhouse gas emissions and air pollution, many ports and shipping companies are adopting shore power solutions as a way to comply with environmental regulations. Shore power enables ships to switch off their engines while in port and connect to the local power grid, reducing emissions and noise pollution.

This report studies the global Shore Power Solution demand, key companies, and key regions.
