The global Short-acting EPO Drugs market size is expected to reach \$ 14140 million by 2029, rising at a market growth of 5.9% CAGR during the forecast period (2023-2029).

Short-acting EPO drugs have a wide range of applications in the market, primarily used for treating anemia-related conditions such as anemia associated with chronic kidney disease and in the supportive treatment of leukemia patients. The market size is substantial and continues to grow, particularly in Asian and European regions. Sales have been on the rise, reflecting increasing patient demand and benefiting from ongoing advancements in medical technology. In the future, short-acting EPO drugs are poised for further development, potentially encompassing the treatment of more anemia-related conditions and expanding their market share through innovative therapies and market expansion efforts.

Erythropoietin is produced by interstitial fibroblasts in the kidney in close association with peritubular capillary and proximal convoluted tubule. It is also produced in perisinusoidal cells in the liver. While liver production predominates in the fetal and perinatal period, renal production is predominant during adulthood.

This report studies the global Short-acting EPO Drugs production, demand, key manufacturers, and key regions.
