Abstracts

The global Short-acting Recombinant Human Erythropoietin Drugs market size is expected to reach \$ 14300 million by 2029, rising at a market growth of 6.1% CAGR during the forecast period (2023-2029).

The market for short-acting recombinant human erythropoietin drugs is currently in a steady growth phase, with its size gradually expanding, and sales continuing to rise. These drugs find extensive use in the treatment of anemia, especially in patients with chronic kidney disease, cancer chemotherapy recipients, and individuals requiring correction of hemoglobin levels pre-surgery. Future developments may include further expansion into additional clinical applications and more convenient administration routes, along with improved manufacturing techniques to meet the growing healthcare demands.

Erythropoietin is produced by interstitial fibroblasts in the kidney in close association with peritubular capillary and proximal convoluted tubule. It is also produced in perisinusoidal cells in the liver. While liver production predominates in the fetal and perinatal period, renal production is predominant during adulthood.
