Abstracts

Short bowel syndrome (SBS) is an intestinal disorder associated with malabsorption due to the lack of functional intestine. SBS can be congenital or an acquired condition which can be observed in patients in whom nearly half of the small intestine has been removed due to underlying disease condition.

Scope of the Report:

The medications prescribed for the treatment of SBS include teduglutide and growth hormones (aid in intestinal absorption), proton pump inhibitors (used to treat gastric acid secretions), and anti-diarrheal (to treat the primary symptom of SBS, i.e., diarrhea). As the patients with SBS have lost major part of the intestine, retaining nutrients in such patients through oral nutrition becomes difficult. Hence parenteral nutrition is the preferred mode of treatment in these patients.

The worldwide market for Short Bowel Syndrome is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
