Abstracts

The global Shrimp Farming Probiotics market size is expected to reach \$ 133 million by 2032, rising at a market growth of 7.9% CAGR during the forecast period (2026-2032).

In 2025, global sales of Shrimp Farming Probiotics reached 30,000 tons, with an average selling price of US\$2,500 per ton. Shrimp farming probiotics refer to the selection and cultivation of beneficial microbial strains for shrimp growth, such as lactic acid bacteria, yeast, and Bacillus, applied to shrimp farming water or feed to promote intestinal health, enhance immunity, strengthen disease resistance, and optimize feed conversion rates. These probiotics not only reduce the need for antibiotics during farming but also improve water quality and reduce disease incidence, making them an indispensable technology in modern aquaculture. Upstream raw materials mainly include parent strains, fermentation media, carrier materials, and preservatives, while downstream supplies primarily come from shrimp farming enterprises, feed manufacturers, and aquaculture service providers. In the future, with the advancement of green aquaculture and environmental regulations, shrimp farming probiotics will develop towards higher efficiency, customization, and multifunctionality, with demand expected to further increase, particularly in the Asia-Pacific and Latin America regions. The industry's total capacity is approximately 45,000 tons per year, with a gross profit margin of about 40%. Downstream consumption is mainly driven by shrimp farming, followed by other aquaculture. Among upstream materials, fermentation media and microbial strains account for the largest share of consumption. On the demand side, with increasing emphasis on aquaculture safety and sustainable development, and the growing demand for antibiotic alternatives, the market prospects for probiotics in shrimp farming are broad, especially in high-density farming and international market expansion, presenting significant business opportunities.
