Abstracts

According to our (Global Info Research) latest study, the global SiAlON Ceramics market size was valued at USD 984.1 million in 2023 and is forecast to a readjusted size of USD 1288.4 million by 2030 with a CAGR of 3.9% during review period.

SiAlONs are ceramic alloys based on the elements silicon (Si), aluminium (Al), oxygen (O) and nitrogen (N) and were developed in the 1970s to solve the problem of silicon nitride (Si₃N₄) being difficult to fabricate.

As alloys of Si₃N₄, SiAlONs exist in three basic forms. Each form is isostructural with one of the two common forms of Si₃N₄, beta (?) and alpha (?) and with silicon oxynitride. The relationship between that of SiAlON and Si₃N₄ is similar to that between brass and pure copper. In the latter case, copper atoms are replaced by zinc to give a better and stronger alloy than the mother metal. In the case of SiAlON, there is substitution for Si by Al with corresponding atomic replacement of N by O, to satisfy valancy requirements. The resulting 'solution' (SiAlON) has superior properties to the original pure solvent (silicon nitride).
