## Abstracts

The global SiC Crystal Growth Furnace market size is expected to reach \$ 475 million by 2032, rising at a market growth of 6.3% CAGR during the forecast period (2026-2032).

In 2025, the global production of SiC Crystal Growth Furnace reached 17,850 units, with a global average price of US\$16,800 per unit. The gross profit margin of major companies in the industry was approximately 25%-40%. SiC Crystal Growth Furnace is medium-to-high temperature electric furnaces that use silicon carbide heating elements such as silicon carbide rods and silicon carbide tubes as heating elements. They are mainly used for material sintering, calcination, annealing, ashing, and high-temperature testing, and are commonly found in ceramics, metallurgy, electronics, chemical materials, and scientific research and testing. The upstream of SiC Crystal Growth Furnace mainly includes silicon carbide heating elements, refractory insulation materials, furnace shell steel, temperature control instruments, electrical control systems, and atmosphere/vacuum components. The midstream consists of resistance furnace manufacturers, responsible for furnace design, heating system integration, temperature control system configuration, and overall machine debugging. The downstream mainly serves industries such as inorganic non-metallic materials, metal heat treatment, electronics, chemical functional materials, and scientific research and testing.
