Abstracts

In the SiC Epitaxial CVD system, silicon source and carbon source are introduced in the form of gaseous precursors by accurately controlling the gas flow, temperature, pressure and atmospheric conditions in the reaction chamber, and allow them to melt on the pre-prepared single crystal SiC substrate. A chemical reaction occurs on the substrate, resulting in the growth of a high-quality SiC film oriented along the crystal plane of the substrate that matches the crystal lattice of the substrate. This kind of film is usually used to manufacture high-performance power semiconductor devices, such as diodes, MOSFETs, IGBTs, etc. These devices are widely used in electric vehicles, solar inverters, power conversion systems and other fields that require extremely high efficiency and reliability.
