## Abstracts

The global SiC Laser Annealing Equipment market size is expected to reach \$ 512 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

SiC laser annealing equipment refers to special equipment that uses high-energy laser beams to automatically anneal wafers. Its main function is to project a laser beam spot with a specific shape and uniform energy distribution onto the semiconductor wafer, which is carried and absorbed by a moving workbench for scanning to complete the annealing process of the entire wafer.

At present, the market for laser annealing equipment is mainly concentrated in North America, Europe and Asia Pacific. North America and Europe have a high market share due to their relatively mature technology research and development and application. The Asia-Pacific region is the world's largest market, accounting for nearly 72% of the market share, especially in China, with the booming electronics manufacturing industry, the demand for laser annealing equipment has increased rapidly. Major players in the market include Mitsui Group (JSW), Sumitomo Heavy Industries, SCREEN Semiconductor Solutions, Veeco, Applied Materials and Hitachi, etc. The top three manufacturers account for approximately 63% of the global share. These companies meet the needs of different industries for laser annealing equipment through continuous technological innovation and product upgrades. In addition, with the promotion of intelligent manufacturing and Industry 4.0, laser annealing equipment is gradually developing in the direction of automation and intelligence to improve production efficiency and product quality.

In recent years, SiC has received increasing attention as a next-generation power semiconductor. Compared to Si, SiC has a bandgap three times larger and a dielectric breakdown capability ten times greater, demonstrating superior device performance. However, it is more expensive in terms of materials and processing costs, and is

typically used in electrified railways and power transmission applications. Meanwhile, the recent trend of tightening emissions regulations in many countries has expanded the use of SiC in consumer products such as electric vehicles (EVs, PHEVs, HEVs) and EV charging stations. Against this backdrop, companies have undertaken a series of efforts to increase the diameter of SiC fibers, improve productivity, and simplify manufacturing processes, thereby enabling its cost to meet the requirements of consumer products.

Despite the broad market prospects, the promotion and application of laser annealing equipment still faces some challenges. First, the equipment cost is high, especially in small enterprises and emerging markets, the financial pressure to purchase laser annealing equipment is relatively large. Secondly, the operating skills requirements are high, and professional technicians are required to operate and maintain the equipment, which to a certain extent limits the popularization of laser annealing technology. In addition, with the intensification of market competition, companies need to continuously carry out technological innovation and service upgrades to maintain their competitive advantage.

Looking ahead, the market for laser annealing equipment will continue to grow. As electronic products move toward miniaturization and high performance, the requirements for material processing accuracy and efficiency are also increasing, which will drive the continued advancement of laser annealing technology. In addition, environmental protection and sustainable development will become important considerations in the development of laser annealing equipment. The use of more environmentally friendly laser technology and materials will help companies reduce energy consumption and emissions in the production process.
