## **Abstracts**

According to our (Global Info Research) latest study, the global SiC Wafer Defect Inspection System market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

SiC Wafer Defect Inspection System is a device used in the semiconductor industry to detect and analyze silicon carbide (SiC) wafer defects. SiC wafers are used to produce high power and high temperature electronic devices such as power electronics and radio frequency (RF) devices. Defect inspection systems utilize advanced imaging techniques such as optical microscopy, scanning electron microscopy (SEM), and atomic force microscopy (AFM) to identify and characterize defects on wafer surfaces. These defects may include particles, scratches, pits, cracks and other imperfections that may affect the performance and reliability of electronic devices. The system typically includes software that analyzes the captured images and provides quantitative data on the size, shape and distribution of defects on the wafer. This information is critical for quality control and process optimization during SiC device fabrication. By using defect inspection systems, manufacturers can identify and resolve potential issues early in the production process, reducing yield loss and improving the overall quality of SiC wafers and their manufacturing equipment.
