According to our (Global Info Research) latest study, the global Side Suspension Imaging System market size was valued at US\$ 277 million in 2024 and is forecast to a readjusted size of USD 479 million by 2031 with a CAGR of 8.0% during review period.

The side suspension imaging system is a technology that uses air flow or other suspension technology to suspend an object in the air and conduct non-contact, close-up observation through specific inference equipment. Unlike traditional suspension technology, the side suspension imaging system mainly obtains more comprehensive information about the surface, morphology or internal structure of the object by imaging the suspended object from a third or specific angle. The system is usually used in the fields of surface defect detection of objects or objects, scientific research, etc. It can achieve high-resolution, non-contact dynamic or static effects, and is suitable for application scenarios that require performance and high stability.
