The global Signal Line Common Mode Filter market size is expected to reach \$ 613 million by 2032, rising at a market growth of 6.7% CAGR during the forecast period (2026-2032).

In 2025, global Signal Line Common Mode Filter production reached approximately 1.6 billion Units, with an average global market price of around US\$ 0.23 per Unit.

Signal Line Common Mode Filter refers to an electromagnetic interference (EMI) suppression component installed on signal transmission lines to suppress common-mode noise while allowing the target signal, especially differential or balanced signal transmission, to pass with minimal distortion. It is widely used in electronic systems to improve electromagnetic compatibility (EMC), reduce conducted and radiated interference, and protect signal integrity in high-speed or noise-sensitive communication interfaces. In industrial practice, these common-mode filtering devices are designed for signal lines rather than power lines.
