Abstracts

According to our (Global Info Research) latest study, the global Silane Coupling Agent for Tires market size was valued at US$ 636 million in 2025 and is forecast to a readjusted size of US$ 755 million by 2032 with a CAGR of 2.0% during review period.

Silane coupling agents are used to raise the interplay between the inorganic particles and rubber matrix. The effect of silane coupling agent (CA) as an additive for rubber is of considerable interest because it plays an important role in the silica-filled rubber tires, where both low rolling resistance and wet grip properties are improved. In 2025, global Piezo PVDF Film sales reached approximately 234.84 K MT, with an average price of 2,632 US$/MT. The value chain of silane coupling agents for tires consists of upstream basic chemical raw materials and organosilicon intermediates such as silicon metal, methyl chloride, ethanol, sulfur, and allyl chloride.

Silane coupling agents for tires, enabled by their unique chemical bridging function, help achieve the coordinated optimization of rolling resistance, wet grip, and wear resistance, making them a key material in green tire technology. Their downstream customers cover the full tire manufacturing value chain, ranging from leading international tire manufacturers to major domestic producers. Driven by the rapid growth of new energy vehicles and increasing demand for high-performance tires, this product category is expected to maintain strong growth potential. Looking ahead, as environmental regulations become stricter and tire performance requirements continue to rise, silane coupling agents are expected to play an increasingly important role in tire formulations, supporting the rubber industry's transition toward higher efficiency, lower environmental impact, and more advanced material technologies.
