Abstracts

The global Silane Terminated Polymer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The silane functional groups on the polymer can react with moisture in the environment, initiating a hydrolysis reaction. This reaction leads to the formation of silanol groups (Si-OH) on the polymer's surface, which can further react with other silanol groups or with the surface to form strong covalent bonds. These bonds provide adhesion and durability to the polymer when used as adhesives or sealants.

Silane-terminated polymers offer advantages such as excellent adhesion, flexibility, chemical resistance, and weatherability. They are often used in construction, automotive, aerospace, and other industries where strong and durable bonding or sealing properties are required.

A silane-terminated polymer refers to a type of polymer that contains silane functional groups at the end of its molecular chains. Silane is a compound consisting of a silicon atom bonded to organic groups and one or more hydrogen atoms. In the context of polymers, silane groups are incorporated into the polymer structure to provide various properties and functionalities.

The presence of silane groups at the polymer's termini allows for crosslinking or bonding with other materials, such as surfaces or substrates. Silane-terminated polymers are commonly used in adhesive and sealant formulations where they can bond to a wide range of surfaces, including metals, glass, ceramics, and various plastics.
