## Abstracts

Silicon carbide materials are very difficult to process by any AM technology and nearly all current applications are based on reaction bonded silicon carbide (RBSiC). Those—like binder jetting and bound powder extrusion—that do not require light or direct heat as an energy source during the printing process are better suited as SiC is a heat resistant, dark material that does not easily let light through. Silicon carbide materials could be fully exploited through implementation of AM capabilities. SiC is best suited for complex, advanced parts. The defense industry is currently the largest adopter of 3D printed SiC parts, which are used for missile control system as well as, potentially, for lightweight armor components. Another common first adoption segment is production of kiln furniture elements and in general the heat management industry, with current applications in heat exchange systems as well.
