According to our (Global Info Research) latest study, the global Silicon Carbide (SiC) Burn-In Test Machine market size was valued at US\$ 378 million in 2025 and is forecast to a readjusted size of US\$ 590 million by 2032 with a CAGR of 6.6% during review period.

A Silicon Carbide (SiC) Burn-In Test Machine is a specialized thermal-electrical chamber designed to stress SiC power semiconductor devices (e.g., MOSFETs, diodes) under elevated temperature, voltage, and current for extended durations. By cycling through defined temperature profiles (often up to 200 °C) while applying operational or accelerated electrical stress, it identifies early-life failures, latent defects, and reliability-limiting mechanisms before field deployment. Key features include precise temperature control, programmable voltage/current sources, real-time monitoring of device parameters (leakage, threshold shifts), and automated data logging. Such machines are essential in qualifying SiC components for high-reliability applications like electric vehicles, renewable inverters, and aerospace power systems.
