Abstracts

According to our (Global Info Research) latest study, the global Silicon Wafer Reclaim market size was valued at US\$ 715 million in 2024 and is forecast to a readjusted size of USD 1186 million by 2031 with a CAGR of 7.3% during review period.

Silicon Wafer Reclaim is also called regenerated wafers. The source of the reclaimed wafers comes from the monitor wafers and the dummy wafers but not the defect wafers manufactured by the semiconductor fab. Semiconductor manufacturing requires delicate processing. So, equipment environment checks and tests are carried out frequently. Monitor wafers and dummy wafers, which could not qualify as prime wafers, are used for these tasks. Following such use, many of these wafers have their film removed using a chemical solution, and then are re-polished to a mirror finish. After that, these reclaimed wafers can once again be used to check equipment environment, or in equipment operation tests.

In short, prime wafers are not necessarily used in semiconductor manufacturing for things that will not become products. Instead, these roles are filled by inexpensive monitor wafers and dummy wafers, or even less expensive reclaimed wafers which can be used multiple times. Reclamation processing can be applied to reclaimed wafers numerous times before they fall below the thickness necessary for use by customers. This makes them extremely economical.
