Abstracts

According to our (Global Info Research) latest study, the global Silicone Liquid Injection Molding market size was valued at US\$ 1064 million in 2024 and is forecast to a readjusted size of USD 1489 million by 2031 with a CAGR of 5.0% during review period.

Silicone liquid injection molding, or LIM, is a manufacturing process commonly used to make silicone parts (considered a subset of rubber or thermoset) that need to withstand extreme conditions, regardless of the industry. The process is an injection molding process at heart, meaning that materials are injected into a pre-made mold, where heat accelerates part curing. Then, the process repeats itself until the part run is complete. While Silicone LIM is best used for short and long run part production, it can also be utilized in the final stages of the prototyping process as well, as the process permits engineers to experiment with different material configurations to fine tune the product before it is green-lit for production. Plus, since a mold needs to be created for the process to take effect, product developers can save time and money by using Silicone LIM for both final prototyping and production processes.
