Abstracts

The global Silicone Oil Clutch market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Silicone Oil Clutch is a clutch device that uses silicone oil as the transmission medium. It differs from traditional friction clutches, which use friction plates or plates to transmit torque.

The working principle of silicone oil clutch is based on fluid dynamics. It consists of two parts: an input shaft and an output shaft, and the space between them is filled with silicone oil. As the input shaft rotates, it stirs up silicone oil, which transfers torque to the output shaft through the clutch's internal passages. Clutch operation can be adjusted by controlling the flow of silicone oil, allowing control of torque delivery.
