Silver contact rivets are electrical contact components primarily made of silver or silver - based alloys. Silver is a key material due to its excellent electrical conductivity. Pure silver has one of the highest electrical conductivities among metals, which allows for efficient transfer of electrical current through the rivet. In some cases, silver is alloyed with other elements such as nickel, cadmium, or tin. For example, silver - nickel alloys are used to combine the high conductivity of silver with the hardness and wear - resistance of nickel. The nickel content in such alloys can vary, typically ranging from a few percent to around 30%, depending on the specific requirements of the application.
