## Abstracts

According to our (Global Info Research) latest study, the global SimDis Analysis Software market size was valued at US\$ 166 million in 2025 and is forecast to a readjusted size of US\$ 247 million by 2032 with a CAGR of 5.8% during review period.

Simulated distillation analysis software is specialized software for gas chromatographs. By analyzing the elution sequence of oil components in a non-polar chromatographic column, it quickly determines the boiling point distribution and distillation range of petroleum products (such as gasoline, diesel, and crude oil). It conforms to standards such as ASTM and converts chromatographic data into simulated distillation characteristic curves.

The industry is primarily driven by both the pressure of energy transition and technological hardware upgrades. Firstly, there's the precision yield management under integrated refining and chemical processes: with narrowing profit margins, the energy savings and yield improvements achieved by lowering the cut-off temperature by 1°C directly determine a refinery's competitiveness. This forces companies to purchase more precise simulated distillation software to replace inefficient physical distillation. Secondly, the implementation of global carbon footprint audit policies allows software to analyze residue oil content, helping companies optimize hydrotreating processes and thus reduce carbon intensity.
