## **Abstracts**

According to our (Global Info Research) latest study, the global Simulated Mouth market size was valued at US\$ 329 million in 2024 and is forecast to a readjusted size of USD 452 million by 2031 with a CAGR of 4.7% during review period.

The artificial mouth is a special artificial sound source, also known as an artificial mouth or an artificial mouth. The artificial mouth is usually composed of a small speaker mounted on a specially shaped baffle. The shape of the baffle is designed to simulate the average directivity and radiation pattern of the human mouth. In order for the artificial mouth to produce a constant sound pressure output and achieve a certain sound frequency response, a frequency compensation network or sound compression is required. The artificial mouth is mainly used to simulate the actual working conditions to test or calibrate the electroacoustic characteristics of the transmitter. Specifically, it is suitable for testing the acoustic parameter indicators of equipment such as telephone transmitters and microphones (microphones) used in voice communication networks. These acoustic parameters may include frequency response, distortion, etc.

This report is a detailed and comprehensive analysis for global Simulated Mouth market. Both quantitative and qualitative analyses are presented by manufacturers, by region & country, by Type and by Application.
