Abstracts

The global Single-Cavity Dual-Comb Laser market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A single-cavity dual-comb laser is a special type of laser that combines the properties of an optical comb and a laser. An optical comb is a highly stable light source that can generate a large number of uniformly distributed spectral lines, and is widely used in frequency measurement, optical frequency synthesis and other fields. A laser is a light source with high coherence and high power output. Single-cavity dual-comb lasers achieve the ability to simultaneously generate multiple coherent beams in a single laser by introducing the spectral lines of the comb into the laser cavity. The frequency difference between these beams can be controlled very precisely, and thus can be used in applications such as frequency measurement, frequency synthesis, optical clocks, optical communications, and more. Compared with traditional optical combs and lasers, single-cavity dual-comb lasers have a simpler structure and higher stability. It can achieve highly coherent multi-beam output with high power and high frequency accuracy, so it has broad application prospects in precision measurement and optical communication.
