Single Chip DLP Projectors display colors in a sequential manner, that is, the light passes through the continuously rotating color wheel to display three colors in a cycle. Since the time interval for displaying different colors is very short, the human eye cannot accurately distinguish them, so the viewer's perception will make the projection The machine displays a certain fixed color. Three Chip DLP Projectors use prisms to split the light from the bulb, and each primary color of light is routed to its own DLP chip, where it is recombined and routed out through a lens.
