## Abstracts

According to our (Global Info Research) latest study, the global Single-Chip Microprocessors market size was valued at US\$ 72068 million in 2025 and is forecast to a readjusted size of US\$ 121448 million by 2032 with a CAGR of 7.7% during review period.

In 2025, global Single-Chip Microprocessor output reached about 35 billion units and global capacity of around 40 billion units. The average price is about USD 2 per unit, with gross margins near 48%. A Single-Chip Microprocessor is an integrated semiconductor device that incorporates the complete central processing unit (CPU) of a computer or embedded system onto a single silicon chip, including arithmetic logic units (ALU), control units, registers, cache memory, and often integrated graphics, AI accelerators, or communication interfaces. These microprocessors are widely used in personal computers, servers, smartphones, automotive electronics, industrial automation systems, consumer electronics, networking equipment, medical devices, and IoT products due to their compact size, high computing performance, and low power consumption. The supply chain of Single-Chip Microprocessors begins with upstream suppliers of semiconductor-grade silicon wafers, rare gases, photoresists, electronic chemicals, photomasks, and semiconductor manufacturing equipment such as lithography, etching, deposition, and testing systems. Midstream activities involve chip architecture design, IP core licensing, electronic design automation (EDA) software development, wafer fabrication at advanced semiconductor foundries, packaging, assembly, and semiconductor testing performed by IDMs, fabless chip companies, and OSAT providers. Downstream industries include PC and server manufacturers, smartphone OEMs, automotive electronics suppliers, industrial control equipment manufacturers, telecom infrastructure providers, cloud computing companies, and smart

device producers that integrate single-chip microprocessors into end-use electronic systems.
