According to our (Global Info Research) latest study, the global Single-end Glass Fiber Roving market size was valued at US\$ 6445 million in 2025 and is forecast to a readjusted size of US\$ 8933 million by 2032 with a CAGR of 4.7% during review period.

Single-end glass fiber roving, also known as fiberglass direct roving, is an untwisted continuous glass fiber roving produced by drawing filaments directly from bushings, gathering them into a parallel strand, applying a sizing system and winding them onto packages. It is a core reinforcement material for composite manufacturing. Key upstream materials include silica sand, pyrophyllite, limestone, boron minerals, soda ash, kaolin, alumina and sizing systems compatible with thermoset or thermoplastic resins, such as silane-, epoxy- and polyurethane-based formulations. It is mainly used in pultrusion, filament winding, weaving, knitting, LFT/GMT, thermoplastic composites and preregs. Downstream applications include wind blades, automotive lightweight components, pipes, tanks, pressure vessels, construction profiles, cable strength members, marine, aerospace and sports equipment.

In 2025, global single-end glass fiber roving production reached approximately 6.8 million tons, with an average global market price is \$900 per ton.

From a global industry perspective, single-end glass fiber rovings are among the most important base reinforcements for continuous-fiber-reinforced composites. Compared with assembled rovings, single-end rovings are typically supplied as one continuous strand package, offering more stable unwinding tension, lower fuzz, better fiber-orientation consistency and stronger continuous-feeding performance. This makes them especially suitable for pultrusion, filament winding, weaving and long-fiber thermoplastic

processes that require fiber continuity, uniform tension and efficient resin impregnation. 3B Fibreglass describes direct rovings as continuous filaments bonded into a single strand and wound onto a bobbin, suitable for filament winding, pultrusion, knitting and weaving, texturisation and long-fiber technologies. Therefore, the value of single-end glass fiber rovings is not limited to fiberglass strength; it directly affects unwinding stability, resin wet-out quality, fiber distribution, laminate strength, surface appearance and batch-to-batch production consistency.

In terms of industry trends, single-end glass fiber rovings are moving toward higher strength, more stable tex, lower fuzz, fewer breaks, faster wet-out, lower static, uniform unwinding, resin-specific sizing and stronger compatibility with automated forming. Traditional direct rovings focused mainly on linear density, tensile strength and price, while downstream users increasingly evaluate sizing formulation, unwinding tension, filament-damage control, resin penetration speed, package formation, low static and batch stability. For thermoset composites, single-end rovings must match UP, VE and epoxy systems while meeting fast wet-out and high glass-loading requirements in pultrusion, filament winding and weaving. For thermoplastic composites, single-end rovings must support rapid impregnation in LFT/D-LFT processes while retaining longer fiber length to improve impact strength, stiffness and dimensional stability. Johns Manville's LFT direct roving description also emphasizes rapid impregnation in a pultrusion process before the impregnated strands are cooled and cut into specified-length long-fiber thermoplastic pellets.

The main growth drivers come from three areas. First, pultruded profiles, composite rebar, cable trays, gratings, FRP pipes, storage tanks, pressure vessels, marine parts, wind components and construction materials continue to require high-strength, corrosion-resistant and continuously processable fiberglass reinforcement. Second, demand for high-performance composites in automotive lightweighting, electrical and electronics, rail transit, wind power, infrastructure, oil and gas pipelines and industrial equipment is pushing single-end rovings from general-purpose grades toward thermoset-specific, thermoplastic-specific, winding-specific, pultrusion-specific and weaving-specific products. Third, downstream composite manufacturers increasingly focus on automation efficiency, resin wet-out speed, mechanical performance, surface quality and long-term reliability, turning single-end glass fiber rovings from ordinary fiberglass rovings into critical intermediate materials affecting composite strength, processing efficiency and large-scale manufacturing stability.
