## Abstracts

According to our (Global Info Research) latest study, the global Single Frequency Laser Interferometer market size was valued at US\$ 55.1 million in 2024 and is forecast to a readjusted size of USD 67.8 million by 2031 with a CAGR of 3.0% during review period.

Single-frequency laser interferometer is an instrument that uses the principle of laser interference for measurement. The single-frequency laser interferometer uses a laser to emit a beam, which is then expanded and collimated and then split into two paths by a beam splitter. These two paths of light are reflected back from the fixed reflector and the movable reflector respectively, and meet on the beam splitter to produce interference fringes. The changes in these interference fringes are related to the displacement of the movable reflector, so that the measured length can be precisely measured.
