Abstracts

The global Single Gene Genetic Disease Screening Services market size is expected to reach \$ 1997 million by 2032, rising at a market growth of 7.0% CAGR during the forecast period (2026-2032).

Single Gene Genetic Disease Screening Services are clinical testing services designed to analyze a specific gene to determine the presence or absence of pathogenic variants associated with a particular inherited disorder. These services are used for targeted screening, confirmatory testing, or family cascade testing in cases where a specific condition is suspected, enabling clinicians and patients to assess inherited risk, guide reproductive or clinical decisions, and plan appropriate follow-up care.

The single gene genetic disease screening services market occupies a targeted and clinically driven niche within the broader genetic testing landscape, where demand is shaped more by medical decision points than by population-scale screening initiatives. Utilization is typically triggered by family history, known pathogenic variants, positive results from broader screening, or specific clinical suspicion, which gives the market a steadier but less explosive growth profile than panel-based screening. Competitive differentiation centers on analytical accuracy, depth of variant interpretation, turnaround time, and the ability to support clinicians with clear reporting and follow-up pathways, including cascade testing and confirmatory workflows. Over time, the market is likely to remain resilient as a necessary complement to expanded screening and sequencing programs, even as standalone volumes face pressure from multi-gene panels that can reduce the need for isolated single-gene tests in some care settings.
