Abstracts

According to our (Global Info Research) latest study, the global Single Lacrimal Canaliculus Stent market size was valued at US\$ 19.12 million in 2025 and is forecast to a readjusted size of US\$ 34.49 million by 2032 with a CAGR of 8.6% during review period.

A single lacrimal canaliculus stent is a minimally invasive medical device specifically designed to maintain the patency of a single lacrimal canaliculus. Typically made of flexible silicone or biocompatible materials, it is inserted into the lacrimal canaliculus and fixed within the lacrimal duct to prevent postoperative stenosis or occlusion. This stent design simplifies the insertion procedure, reduces damage to the lacrimal sac and surrounding tissues, and supports lacrimal duct self-healing and long-term functional recovery while maintaining normal tear drainage.

From a clinical and medical device perspective, the single lacrimal canaliculus stent is widely considered the preferred minimally invasive option for treating unilateral lacrimal canaliculus stenosis or obstruction due to its ease of use, minimal invasiveness, and good patient tolerance. Compared to traditional double lacrimal canaliculus or lacrimal sac stents, the single lacrimal canaliculus stent reduces surgical complexity and complication risks while maintaining normal tear drainage, thus improving surgical success rates and postoperative quality of life. Therefore, it has significant clinical application value in ophthalmic lacrimal duct reconstruction surgery.

In 2025, the average price of a single lacrimal canaliculus stent is \$17 per unit, with sales of 1.093 million units, a total production capacity of 1.56 million units, and a gross profit margin of approximately 48%.
