Abstracts

According to our (Global Info Research) latest study, the global Single-Pad Wireless Chargers market size was valued at US\$ 3054 million in 2025 and is forecast to a readjusted size of US\$ 4284 million by 2032 with a CAGR of 5.0% during review period.

A single-PAD wireless charger is a charger specifically designed to wirelessly charge a single device. It typically uses the Qi standard and transfers power from the charger to a phone, headset, or other compatible device via electromagnetic induction, eliminating the need for physical cables.

The upstream sector primarily includes suppliers of raw materials and core components, such as wireless charging coils, PCBs, IC chips, power adapters, and plastic and metal casings. These components are mostly supplied by electronic component manufacturers and material suppliers. The midstream sector comprises wireless charger design and manufacturing companies, including single-PAD wireless charger brand manufacturers and ODM/OEM manufacturers, responsible for product development, structural design, functional testing, and assembly. The downstream sector involves distribution channels and end-user sales, covering online e-commerce platforms, offline retailers, brand-owned stores, and corporate/office procurement channels.

In 2025, global sales of single-PAD wireless chargers reached 140 million units, with a production capacity of approximately 210 million units. The average selling price was \$21.2 per unit, and the average gross profit margin was 25%-35%.

The demand for single-pad wireless chargers primarily stems from the increasing

penetration rate of consumer electronics, especially smartphones, true wireless earbuds, and smartwatches, which demand a seamless and fast charging experience. Beyond the consumer market, emerging applications such as in-vehicle wireless charging, smart homes, and office environments are also significant growth drivers. As the number of smart devices increases, consumers have a continuous demand for convenient and tidy charging methods, which is driving the widespread adoption of wireless charging products. In the coming years, wireless charging applications in IoT devices and laptops are also likely to grow rapidly.

Wireless charging technology is evolving from basic electromagnetic induction to more efficient and flexible solutions. The mainstream technology remains mature magnetic induction, offering good compatibility and low cost, and is widely used in single-pad and multi-device chargers. On the other hand, new technologies such as magnetic resonance and radio frequency long-distance charging are gradually entering practical application pilots, laying the foundation for a more flexible charging experience in the future. Furthermore, with the promotion of standards such as Qi2, magnetic positioning, thermal management optimization, and higher power output (e.g., above 30W) are also becoming technological development directions, helping to improve user experience and cross-device compatibility.
